

The Modbus 4-channel relay module can be used to switch four electrically isolated relays via a Modbus interface. Various time functions can be used to influence the switching behavior.

All parameters can be set via the Modbus RTU interface and via a programming socket behind the front panel. A free PC configuration software also offers extended setting options and extensive diagnostic functions during operation. A subset of the most common settings is also available via DIP switches.

The 5 port isolation guarantees reliable decoupling of the outputs from each other and from the processing circuit and the auxiliary power circuit. Power supply and Modbus RTU are connected via the rear-mounted In-Rail-Bus connection (see Accessories).
