SAFETY PRECAUTIONS
You must read carefully all the instructions of this manual. You must not start the installation before taking these instructions into account. This equipment might receive some hazardous voltages. If you do not consider these instructions, you risk facing serious corporal and/or material injuries. Before setting up your installation, check the model suit your application. The wiring of this equipment must be executed with the in force rules by a qualified staff.

1 GENERAL WARNINGS

1.1 PREMISE
Before installation of the instruments follow the recommendations listed in European normative EN 837-2.
In particular is necessary to check if:
- Required security level is compatible with the safety markings indicated on instrument dial.
- Process fluid is compatible with wetted parts indicated on instrument dial.

WARNING:
When instrument is installed on dangerous fluids like oxygen, acetylene, or fluids that are inflammables or toxics or dangerous for the environment, please check carefully that instrument is suitable for these applications.
Especially for use with oxygen the instrument dial must show the word “OXYGEN” and the international symbol of “Oil-free”. Pressure gauges must not come in contact with oils or greases not compatibles with oxygen.
In the event of installation in potentially explosives atmospheres, the instrument dial must show the markings foreseen from ATEX 94/9/EC directive. Installation is possible only following the rules foreseen.

1.2 NOTES ON APPLICABILITY OF PRESSURE DEVICES DIRECTIVE (PED 97/23/CE)
Georgin pressure gauges M5000 are considered “pressure accessories”, according art. 1 clause 1.2.4.
Instruments with static pressure higher than 200 bar are manufactured according A module of the directive and must have CE logo on dial.
Instruments with static pressure lower than 200 bar must not be marked with CE logo but are manufactured according to art. 3 clause 3 *sound engineering practice* (SEP).

1.3 INSTRUMENT MEASURING RANGE
Verify that measuring range of instrument is suitable with working conditions of the pressure circuit/plant. Normal operating pressure must be:
- Within 75 % of dial range for steady pressures
- Within 60 % of dial range for pulsating pressures
The choice of non-suitable range, or not suitable model, or non-suitable installation, causes not proper functioning and shorter working life of instrument.

1.4 ADMITTED OVER PRESSURES
Accidental over pressures are admitted for short periods, provided that they remain within the values indicated in the catalogue.

1.5 AMBIENT TEMPERATURE
Instruments are designed to work with an ambient temperature between -40°C/+60°C (-40°F/+140°F). It is recommended to verify that the pressure gauge installation position is not subject to direct heat sources, both for convection or radiation: if this is not possible, please foresee a protective screen. Temperature variations of sensing element, compared with reference temperature, cause indications drift (accuracy errors) lower than ±0.4 % of read value, every 10 °C of ambient temperature variation.

1.6 PROCESS FLUID TEMPERATURE
Instruments are designed to work with a process fluid temperature within -40°C/+200°C (-40°F/+392°F).
If instrument is filled with dampening fluid, maximum temperatures admitted of process fluid, are indicated in table 1.
In event of installations on steam, we recommend to follow installation sketches of Figure 1 and suggestions indicated in paragraph 2.3.

1.7 MECHANICAL VIBRATIONS
Verify that chosen position for the installation is not subjected to continuous mechanical vibrations, because this will cause accuracy errors and shorter working life of instrument. If this is not possible, it is recommended to use instruments filled with dampening liquid.

1.8 PULSATING PRESSURES
In the event that instrument is subjected to pulsating pressures, please foresee a dampening protection, like mechanical dampeners (screw type or porous disc type) or restriction screw inserted into the socket. These accessories are available upon request.

1.9 INSTALLATION IN POTENTIALLY EXPLOSIVE ATMOSPHERES (GAS AND DUST)
The instrument can be installed in potentially explosives atmospheres only if on dial are indicated the markings showed on figure 1. The temperature classification of the instrument depends only from the working conditions (maximum ambient and process fluid temperature). The differential pressure gauges series M5000 does not contain any potential ignition source.

2 INSTALLATION

2.1 PROCESS CONNECTIONS
For the process installation of the instrument, we recommend to use the key flat foreseen on the instrument socket.

WARNING: Do not use the case for to screw or lock the instrument to the process connection.

In the event that instrument will be surface or panel mounted, it is necessary to foresee a flexible piping to connect it to the process. The sealing of process connection is normally guaranteed by using:
- A flat gasket, if using cylindrical connections
- A sealing material, such as PTFE tape, if using tapered connections (NPT or BSPT).

The serration torque depends only from gasket type.

WARNING: When pressure is applied for the first time to the mounted instrument, please check the sealing of the connection, especially when instrument is mounted with dangerous and/or toxic and/or aggressive fluids. Please be very careful with this check, if process fluid is dangerous.

2.2 PANEL (FLUSH) OR SURFACE (WALL) MOUNTING
For panel or surface mounting consider that a space of about 25mm. must be leaved free between the back side of instrument and the wall. This permits the exit of the safety blow out disc.

2.3 MOUNTING ON STEAM APPLICATIONS (FIGURE 1)
When instrument is used on steam applications is necessary to foresee a coil siphon, mounted between process and instrument connection. The coil siphon must be filled with water, for to avoid that steam enter into the instrument.

In the event that instrument is occasionally subjected to vacuum, is necessary to shape the process piping in a way that the coil siphon remain always water filled. The possible accuracy error, given from weight of water column, could be compensated by using the micrometric adjustment on the pointer (see paragraph 4.1).

3 CALIBRATION AND CHECK
As good practice, is better to make a complete check of the instruments twice per year.

The calibration check is normally made by comparing the instrument with a suitable test instrument. Check is carried out on the main divisions of the dial, following the prescription of European normative EN 837.

It is possible to make a fast check of functioning and accuracy of the instrument, verifying the pointer indication at beginning of scale (zero indication).

If zero pointer indication, at atmospheric pressure, is within the 2% of range, it will be highly probable that instrument is in good efficiency. A zero drift of more than 2% could mean a stress fatigue of the instrument.

Every pressure gauge that has been subjected to abnormal working conditions must be substituted.

WARNING: The instrument doesn’t need any particular maintenance.

Do not lubricate the moving parts because this could attract dust and to form particles and impurities that could produce malfunctions or accuracy errors.

WARNING: In event of accidental breaking of instrument transparent, it is necessary to substitute it immediately, taking care of removing all the small pieces into the case. The substitution of transparent is mandatory if instrument is mounted in potentially explosives atmospheres with dust.

4.1 ZERO ADJUSTMENT OF INSTRUMENT
If the instrument needs zero adjustment, after removing bayonet ring and transparent, is necessary to act on the micrometric screw, situated on the pointer. We suggest to use proper tools for to open the bayonet ring, if this results strongly closed (eg. opening belt).

4.2 INSTRUMENT WITH LIQUID FILLING
The level of dampening fluid must be periodically controlled. If a further filling is necessary, we recommend however to don’ t fill over 75 % of case diameter.

4.3 CLEANING
External cleaning of the instrument could be done by using a sponge with soaped water.

Internal cleaning, necessary in case you need to verify calibration with an hydraulic press, could be made by using compressed air inside the socket hole. Please be careful to the process fluid traces that could remain inside the sensing element, especially if fluid is toxic or dangerous.

WARNING: The instruments that are mounted in potentially explosives atmospheres due to burnable dust, must be periodically externally cleaned for to avoid the dust accumulation.

5 PUT OUT OF SERVICE
Before to dismount the instrument from the working circuit is necessary to control that:
- Instrument is isolated from process fluid
- No pressure is present inside the instrument
- Temperature of the case is not excessive

Please be careful to the process fluid traces that could remain inside the sensing element, especially if fluid is toxic or dangerous.

6 DEMOLITION
The instrument is essentially made in stainless steel. Therefore, after removing transparent, gasket, plugs and after removing all the process fluid traces from the wetted parts (especially if fluid is dangerous for peoples or ambient) the instrument could be recycled or scraped.

DECLARATION DE CONFORMITÉ
STATEMENT OF CONFORMANCE

We,

REGULATEURS GEORGIN - 14/16 rue Pierre SEMARD - 92320 CHATILLON - FRANCE

Declare under our own responsibility that Manometers series M5000, manufactured according to technical specification SP 02 Rev 2 of 05/08 comply to the essential requirements of Directive ATEX 94/9/CE.

The instruments M5000 does not contain potential source of ignition. Their maximum surface temperature depends only from the operating conditions (maximum temperature of process fluid).

The conformity to the Directive is evaluated with form VIII (manufacturing internal checks).

The technical file N° FT08/001 rev3 was deposited on 07/01/2010 at the notified body:

IMO [Number : 0051]
Via Quintiliano 43
20138 Milano – Italia

The instruments are classified as:

<table>
<thead>
<tr>
<th>Type</th>
<th>Marquage / Marked</th>
<th>Normes / Standards</th>
</tr>
</thead>
</table>
| M5000 | II 2GD c T(see table) IP65 T(see table) | EN 13463-1
|       |                   | EN13463-5           |

The temperature classification depends only from the operating conditions, according the following table:

<table>
<thead>
<tr>
<th>Ambient temperature</th>
<th>Maximum operative temperature</th>
<th>Temperature class (Gas)</th>
<th>Temperature class (Dust)</th>
</tr>
